DEMENTIA TRIAL ACCELERATOR(DTA)

DTA aims to accelerate dementia research by improving the identification of potential participants for clinical trials and to speeding up recruitment for trials

Background:

Dementia affects over 55 million people worldwide, with cases set to rise sharply. Trials are often slow, costly, and struggle with recruitment. Faster, more efficient studies are vital to bring effective treatments
to patients sooner.

Objective:

The Dementia Trial Accelerator (DTA) aims to speed up dementia research by improving trial design, streamlining recruitment, and fostering collaboration to bring new treatments to patients faster.

Method:

DTA brings together researchers, clinicians, patients, and industry partners. It provides trial support, shares data and resources and applies innovative approaches to recruitment and study design.
